About me

I am a software engineer at PageProof, a small remote team building online proofing for marketing and creative teams. My part is the integrations platform: the plugins that let people review proofs inside Canva, Microsoft Office, Adobe Creative Cloud, Final Cut Pro and Jira, the OAuth 2.0 / OpenID Connect server, and the Electron desktop app. Most of it is TypeScript, React and Node.js; Swift and C++ appear when a host leaves no other option. **Languages:** Portuguese (native) and English (fluent).

Skills

Languages: TypeScript, JavaScript, Node.js, Swift, C++
Frameworks & platforms: React, Electron, Vite, Adobe UXP, Canva Apps SDK, Office.js, Atlassian Forge
Infrastructure: OAuth 2.0 / OIDC, Kubernetes, Azure, Cloudflare Workers, Redis, GitHub Actions
AI: MCP servers, agentic coding with Claude Code

Work experience

Software Engineer, Integrations platform Mar. 2023 – Present
PageProof.com Limited *Remote*

- The integrations act on a user's PageProof account, so PageProof must issue their tokens. I designed one OAuth 2.0 (RFC 6749) server with OpenID Connect that nine of them sign in through, from the Adobe and Office plugins to Figma, Microsoft Teams and the MCP server Claude and ChatGPT use. It is moving to Kubernetes.
- I built the integrations that bring the review into the tools reviewers already use: the Canva, Microsoft Office, Final Cut Pro and QuarkXPress plugins and the Premiere Pro panel; I co-developed the Adobe UXP plugins and am rebuilding the Microsoft Teams app. The others now follow the setup I introduced: Bolt UXP for every Adobe plugin, React Query for data, and the CI I built for every repository.
- I am the main engineer on the Electron desktop app. Its comments panel was extracted into one package shared with the Adobe plugins, so a fix lands in every host at once.
- I built the Jira integration, which links a proof to its issue and keeps the two in step: status comments, remote links and the approved file sync automatically, on a Node.js service with Redis locks to keep events in order. I took the Atlassian Forge app through Atlassian's review, and it is live on the Atlassian Marketplace.
- I built the providers that deliver approved files to where each team keeps them: OneDrive, SharePoint, Canto and Bynder, with credentials encrypted per team. Dropbox and Google Drive are in progress.

Operations Research Analyst Jan. 2022 – Sep. 2022
CTT – Correios de Portugal, S.A. *Lisbon, Portugal*

- I worked on the last-mile step of mail delivery, where a postman leaves the distribution centre and visits every postal code on a route. The goal was a routing model CTT could apply to any centre in Portugal.
- I modelled it as a vehicle routing problem under CTT's constraints and grouped postal codes into segments so routes stay stable from day to day, with Tableau dashboards for planning. This work became my MSc thesis.

Projects

igcp-aforro | *TypeScript library & CLI*

- A simulator for Portuguese Treasury Certificates (Séries A to F), built from the formulas in the law and published on npm with a CLI, documentation, an HTTP API and an MCP server, so a language model can quote a simulation instead of estimating one.

pnl | *private double-entry ledger, TypeScript & Electron*

- A ledger of my own accounts that reads statements from over a dozen banks, brokers and exchanges. I built it with coding agents, so nothing they write is trusted unchecked: each import is held to the bank's own balance, and over 3,000 tests hold every report to the cent.

Education

NOVA University Lisbon Sep. 2020 – Dec. 2022
Master of Science in Computer Science *Lisbon, Portugal*

- *Coursework:* Artificial Intelligence, Concurrency and Parallelism, Information Retrieval, Machine Learning

Technische Universität Dresden Apr. 2021 – Oct. 2021
Erasmus+ Programme Mobility in Computer Science *Dresden, Germany*

NOVA University Lisbon Sep. 2017 – Sep. 2020
Bachelor of Science in Computer Science *Lisbon, Portugal*
