About me

I am a software engineer at PageProof, a small remote team building online proofing for marketing and creative teams. My part is the integrations platform: the plugins that let people review proofs inside Canva, Microsoft Office, Adobe Creative Cloud, Final Cut Pro and Jira, the OAuth 2.0 / OpenID Connect server that authenticates them, and the Electron desktop app. Most of it is TypeScript, React and Node.js; Swift and C++ appear when a host leaves no other option. **Languages:** Portuguese (native) and English (fluent).

Skills

Languages: TypeScript, JavaScript, Node.js, Swift, C++
Frameworks & platforms: React, Electron, Vite, Adobe UXP, Canva Apps SDK, Office.js, Atlassian Forge
Infrastructure: OAuth 2.0 / OIDC, Kubernetes, Azure, Cloudflare Workers, Redis, GitHub Actions
AI: MCP servers, agentic coding with Claude Code

Work experience

Software Engineer Mar. 2023 – Present
PageProof.com Limited *Remote*

- Reviewers work inside design and editing tools, so the integrations bring the review to them. I built the plugins for Canva, Microsoft Office, Final Cut Pro and QuarkXPress, co-developed the Adobe UXP plugins, and built the Premiere Pro panel, which orders comments by timecode so the editor can jump straight to each one.
- The Jira integration links a proof to its issue and keeps the two in step: status comments, remote links and the approved file sync automatically, on a Node.js service with Redis locks to keep events in order. The Atlassian Forge app is live on the Atlassian Marketplace.
- Approved files are delivered to where each team keeps them: I built the providers for OneDrive, SharePoint, Canto and Bynder, with credentials encrypted per team. Dropbox and Google Drive are in progress.
- Every plugin and the desktop app need to know who the user is, so I designed one OAuth 2.0 (RFC 6749) authorization server with OpenID Connect, in Node.js, that all of them share. It is now moving to Kubernetes.
- I am the main engineer on the Electron desktop app. Its comments panel was extracted into one package shared with the Adobe plugins, so a fix lands in every host at once.
- The Office add-in runs AI-assisted checks before a file becomes a proof; I built the interface for their results.

Operations Research Analyst Jan. 2022 – Sep. 2022
CTT – Correios de Portugal, S.A. *Lisbon, Portugal*

- I worked on the last-mile step of mail delivery, where a postman leaves the distribution centre and visits every postal code on a route. The goal was a routing model CTT could apply to any centre in Portugal.
- I modelled it as a vehicle routing problem under CTT's constraints and grouped postal codes into segments so routes stay stable from day to day, with Tableau dashboards for planning. This work became my MSc thesis.

Projects

igcp-aforro | *TypeScript library & CLI*

- A simulator for Portuguese Treasury Certificates (Séries A to F), built from the formulas in the law and published on npm with a CLI, documentation, an HTTP API and an MCP server, so a language model can quote a simulation instead of estimating one.

pnl | *private double-entry ledger, TypeScript & Electron*

- A ledger of my own accounts that reads statements from over a dozen banks, brokers and exchanges. I built it with coding agents, so nothing they write is trusted unchecked: each import is held to the bank's own balance, and over 3,000 tests hold every report to the cent.

Education

NOVA University Lisbon Sep. 2020 – Dec. 2022
Master of Science in Computer Science *Lisbon, Portugal*

- *Coursework:* Artificial Intelligence, Concurrency and Parallelism, Information Retrieval, Machine Learning

Technische Universität Dresden Apr. 2021 – Oct. 2021
Erasmus+ Programme Mobility in Computer Science *Dresden, Germany*

NOVA University Lisbon Sep. 2017 – Sep. 2020
Bachelor of Science in Computer Science *Lisbon, Portugal*
